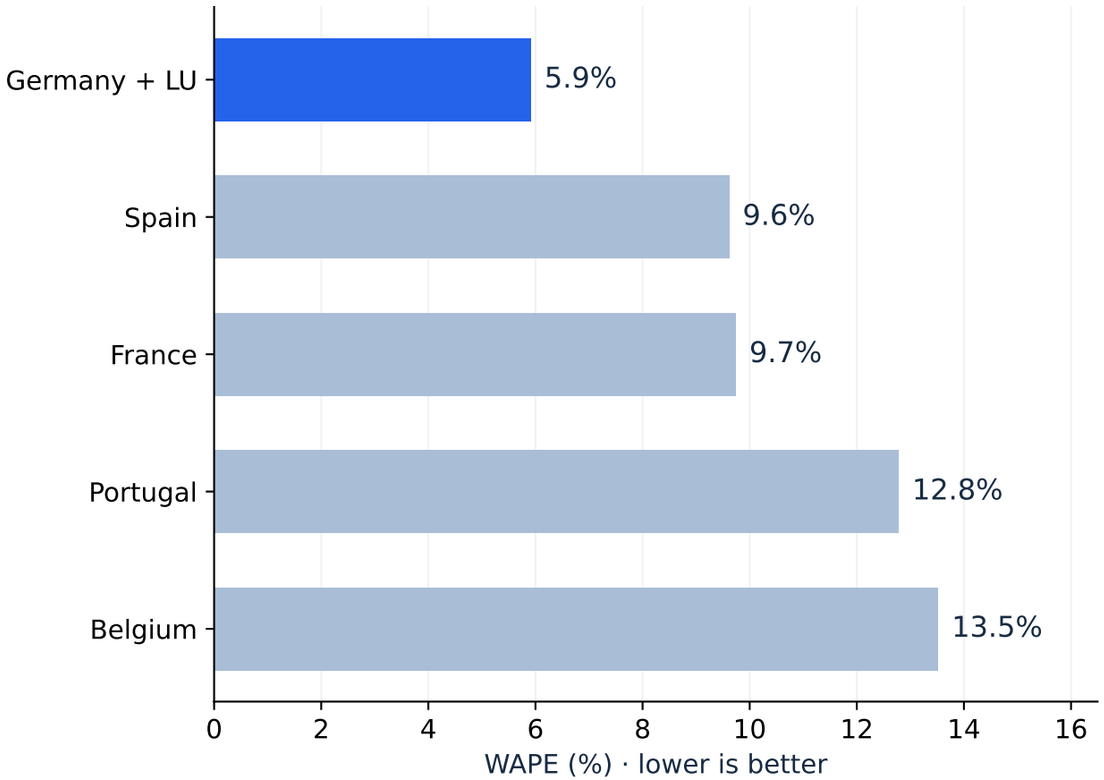
Solar TSO forecast performance | matched delivery windows

Size-normalized comparison of the TSO benchmark curves stored by our dashboard

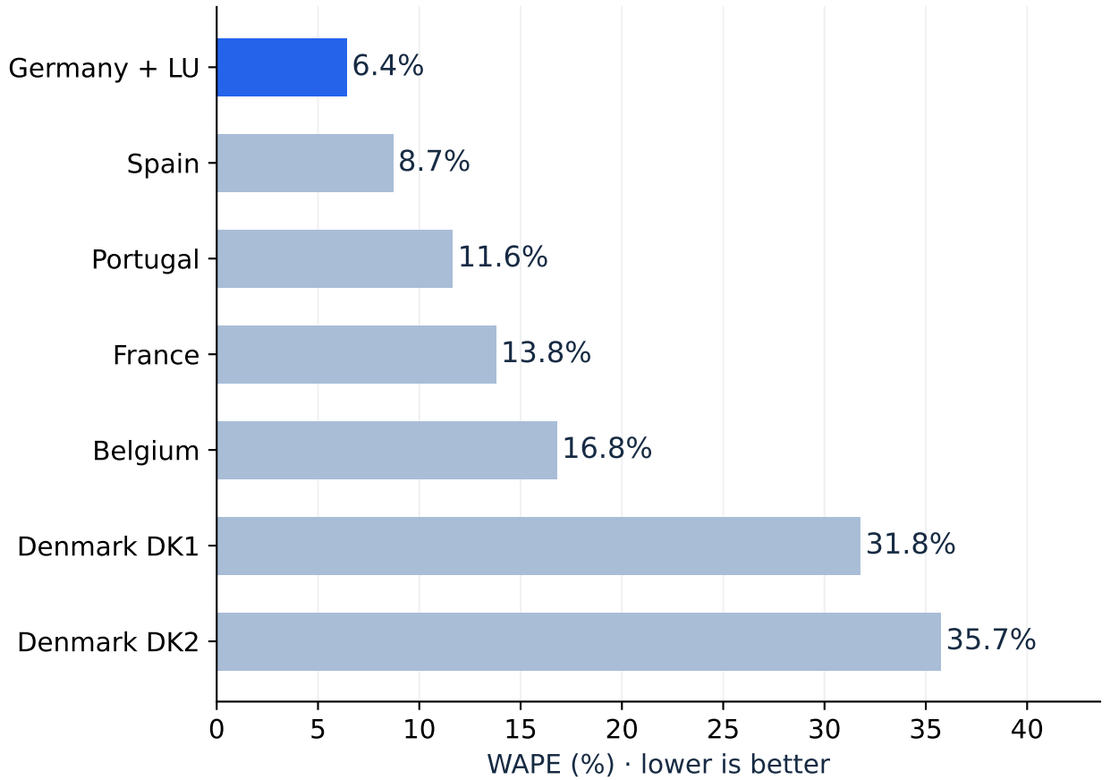
Five national / market aggregates

2026-08-05 → 2026-11-01
82 shared origins · 2,460 delivery hours per area



All seven dashboard areas

2026-09-21 → 2026-11-01
35 shared origins · 1,050 delivery hours per area



WAPE = 100 × sum(|forecast − actual|) / sum(actual). Includes all delivery hours, including night; no division by individual zero-output hours.
Each panel uses identical complete origin dates across its areas; the two panels use different intersections.
DE follows the collector’s DE/LU label; historical fallback domain provenance is incomplete. DK1/DK2 are separate areas.
Includes archived-input replays and current stored revisions; these figures do not establish an intrinsic ranking of operator forecasting skill.
